

```
#include <stdlib.h>
#include <string.h>
#include <ctype.h>
```

```
#define MAXPAROLA 30
#define MAXRIGA 80
```

```
int main(int argc, char *argv[])
```

```
{
    int freq[MAXPAROLA]; /* vettore di contatori
delle frequenze delle lunghezze delle parole */
    char riga[MAXRIGA];
    int i, inizio, lunghezza;
    FILE * f;
```

```
    for(i=0; i<MAXPAROLA; i++)
        freq[i]=0;
```

```
    if(argc != 2)
```

```
    {
        fprintf(stderr, "ERRORE: serve un parametro con il nome del file\n");
        exit(1);
    }
```

```
    f = fopen(argv[1], "rt");
    if(f==NULL)
```

```
    {
        fprintf(stderr, "ERRORE: impossibile aprire il file %s\n", argv[1]);
        exit(1);
    }
```

```
    while( fgets( riga, MAXRIGA, f ) != NULL )
```

Operating Systems Laboratory 2

fgetc, fgets, fscanf, printf

- **int fgetc(FILE *stream)**
 - gets the next character (an unsigned char) from the specified stream and advances the position indicator for the stream.
- **char *fgets(char *restrict s, int n, FILE *restrict stream)**
 - reads bytes from stream into the array pointed to by s, until n-1 bytes are read, or a <newline> is read and transferred to s, or an end-of-file condition is encountered. The string is then terminated with a null byte.
- **int fscanf(FILE *restrict stream, const char *restrict format, ...)**
 - reads bytes, interprets them according to a format, and stores the results in its arguments.
- **printf(const char *restrict format, ...);**
 - Printf a formatted string on standar output

fread and fwrite

- **size_t fread(void *ptr, size_t size, size_t nmemb, FILE *stream) (man fread)**
 - reads nmemb elements of data, each size bytes long, from the stream pointed to by stream, storing them at the location given by ptr.
- **size_t fwrite(const void *ptr, size_t size, size_t nmemb, FILE *stream) (man fwrite)**
 - writes nmemb elements of data, each size bytes long, to the stream pointed to by stream, obtaining them from the location given by ptr.
- fread() and fwrite() return the number of items successfully read or written (i.e., not the number of characters). If an error occurs, or the end-of-file is reached, the return value is a short item count (or zero).
- fread() does not distinguish between end-of-file and error, and callers must use feof() and ferror() to determine which occurred.

POSIX system calls

- **POSIX system calls**

- **open(), read(), write(), close()**

- **Very low level**

- **Uses file descriptors instead of FILE* for unbuffered IO**

- **The STDIO functions are implemented using these functions**

- **ssize_t read(int fildes, void *buf, size_t nbyte) (man 2 read)**

- attempt to read nbyte bytes from the file associated with the open file descriptor, fildes, into the buffer pointed to by buf.

- on success, the number of bytes read is returned (zero indicates end of file), and the file position is advanced by this number.

- **ssize_t write(int fildes, const void *buf, size_t nbyte) (man 2 write)**

- attempt to write nbyte bytes from the buffer pointed to by buf to the file associated with the open file descriptor, fildes.

- on success, the number of bytes written is returned (zero indicates nothing was written). On error, -1 is returned

Redirection

- > Redirect standard output
- >& Redirect standard output and standard error
- < Redirect standard input
- | Redirect standard output to another command (pipe)
- >> Append standard output
- >>& Append standard output and standard error

Examples

```
head -n 20 file.txt > file_out.txt
```

copies the first 20 lines of a file to another

```
myApplication >& log.txt
```

makes a log file of myApplication

```
echo "NEW LINE" >> myFile.txt
```

appends a line to a file

❖ Permissions

Permissions

- Permissions types
 - Read(r)
 - Write(w)
 - Exec(c)
- Permissions classes
 - Owner
 - Group
 - Others

Directory permissions

- Read(r)
 - File listing
- Write(w)
 - Create or delete a file
- Exec(c)
 - directory scanning (using cd command)

chmod symbolic mode

chmod [**<who>**]**<operator><type>** **filename**

Operators

+ → add permission

- → remove permission

= → set permission

Who

u → user **g** → group **o** → other users **a** → all

Type → **r** , **w** , **x**

Example

chmod u+x myfile → add executable permission for the user to myfile
